ABSTRACT

One of the most prevalent methods for assessing the health of a fetus is through fetal movement count monitoring. Mothers are advised by doctors to measure and monitor fetal movements and the manual counting technique based on mothers' perception is unreliable. Utilizing equipment like ultrasound scanners to better identify the features is only permitted in clinical environments. Thus, comprehensive systems that can allow expectant mothers to track fetal activity at home are important. For this task, wearable sensory devices are being evaluated and the use of an inexpensive sensor that is non-intrusive and non-transmitting alongside the processing component for the identification of the events was used for the collection of this dataset. The use of four inertial measurement sensors was combined with a microcontroller-based circuit for the device manufactured and the clinical testing was conducted utilizing the above-mentioned sensor unit. An ultrasound scan of the abdomen was used as the main ground truth during the validation process and the mothers' perception labels were also considered as a form of ground truth in some instances. This variety of ground truths of the dataset allows the researchers to evaluate the validity of both ultrasound fetal movement monitoring and mothers' perception.

Data Description

- **Study type (e.g. experimental, case control, cohort, descriptive etc)** - Experimental Clinical Data Analysis
- **Ethical Clearance:** This study was approved by the Ethics Review Committee, Faculty of Medicine, University of Peradeniya. Approval was granted to conduct research project No. 2018/EC/43 entitled "Fetal movement analysis for condition monitoring" at the Teaching Hospital, Peradeniya, Sri Lanka.
- **Clearly defined population & sample**
 - Pregnant mothers from all 3 trimesters
 - Non pregnant females with matched BMI as a control group

- **Sample size** - 44 pregnant mothers (30 Ward readings, 14 Ultrasound readings)

Ultrasound Readings refer to the subject recordings with Ultrasound observations as the ground truth.

Ward Readings refer to the subject recordings with mothers' perception ground truths.

- **Data Format** - The data file format is Comma Separated Value (CSV), where the top row contains the column names; an example data file is shown in figure 1. Some column names are described in Table 1, and the other column names follow the same format.

File names $U_{i,j}$ refers to the j^{th} recording of the i^{th} subject who participated in the ultrasound study.

File names $W_{i,j}$ refers to the j^{th} recording of the i^{th} subject who participated in the ward study.

Name	Description
time	Time in seconds since the start of the recording
axi	Accelerometer reading in the x-axis of the i th IMU
gyj	Gyroscope reading in the y-axis of the j th IMU
state	Ground-truth label

Figure 1. Example Data File

- **ward_Readings.csv** - Contains information about the recordings with mothers' perception ground truths (shown in figure 2).
- **ultrasound_Readings.csv** - Contains information about the recordings with Ultrasound observations as the ground truth (shown in figure 3).
- **Sampling technique** - Depending on the trimester and weight class of the pregnant mothers.
- **Inclusion and exclusion criteria** - Pregnancy
- **Detailed randomization technique where appropriate** - Maximizing the inclusion of different age groups, BMI values and Gestational Age.
- **Details of the blinding technique and data collection method** - No blinding technique is used, as the gathered data will be used for the validation of readings collected from the prototype device. Data will be gathered from pregnant mothers admitted to the professorial ward of the department of gynecology and obstetrics, University of Peradeniya.

Figure 3. ultrasound_Readings.csv

- **A detailed list of study variables**

- Date
- Starting Time
- Ending Time
- Number of Babies
- Number of previous pregnancies
- Number of Miscarriages
- Fetal Movement Types
- BMI Value
- Mothers Age
- Gestational Age
- Other complication details

- **This dataset was collected to have a good variety in the data and the considered variables. A brief description of the data distribution is given below. This information is also provided alongside each recording. Refer to `ward_Readings.csv` and `ultrasound_Readings.csv` .**

- Mothers with Single, Twin, Triplet pregnancies participated in the study.
- Mothers that expected both Cesarean (C-section) & Vaginal deliveries participated in the study.
- A considerable portion of the participants had belonged to reduced fetal movement categories, which helps to process and evaluate the algorithms in a fail safe manner.
- Mothers who had Miscarriages, Stillbirths before also participated in the study.
- Mothers conditions with abnormal abdominal pain also participated in the study.
- Recording other conditions of the mothers such as Sugar and other complications was done so that one can analyse those recordings separately if needed for some other task.
- Other artifacts such as Cough, Positional changes, Laughs were also recorded. This was done to differentiate between the fetal movements from other movements as the sensors used in the device are sensitive to both events and these artifacts could be mistaken as fetal movements.
- Mothers who participated in the study were from a wide range of BMI Values
- The gestational age and mothers age also had a good distribution. Mothers of all ages from 23 year old to 36 year old participated in the study except for the ages 27, 33, 34. Only participant that did not belong in this age group was a mother of 45 years old and all these information is recorded in the information sheets inside the dataset.

Instrument

Four IMU sensors were used as non-invasive sensors to capture fetal movement vibrations in the maternal abdomen. Each sensor outputs 3 accelerometer readings and 3 gyroscope readings. The device had several modes of operation and it can be identified using figure 4. The completed device is shown by figure 5.

- **Start/Stop** - Power ON and OFF

- **Pos** - Record if the mother has made any sudden movements during the recording process, as it is needed to be filtered to properly not label other abdominal movements as fetal movements.
- **Laugh** - Record if the mother laughed during the recording process, as it is needed to be filtered to properly not label other abdominal movements as fetal movements.
- **Cough** - Record if the mother coughed during the recording process, as it is needed to be filtered to properly not label other abdominal movements as fetal movements.
- **M1 to M4** - These buttons can be used to capture upto 4 different fetal movements such as limb, tunk, general body or these can be attributed to the four quadrants of the belly as well if needed.

Figure 4. Device Layout

Figure 5. The Completed Device

Acknowledgements

We would like to express our sincere gratitude to all the staff members of the maternity ward of Peradeniya Teaching Hospital, Sri Lanka. Our special thank goes to the ward doctors and ward sisters for assisting us in data collection.
